Field Crops: Final Estimates by States, 2002-2007, U.S. Department of Agriculture, Agricultural Statistics Board, National Agricultural Statistics Service, Statistical Bulletin No. 1010.

Introduction: This bulletin presents final estimates, including revisions made by the Agricultural Statistics Board (ASB), for the production years 2002 through 2007. Acreage, yield, and production data were published during calendar years 2003-2008 in periodic ASB reports. Data included in this publication provide a historic record and a benchmark for current estimates.

Procedures: Revisions were made after a thorough review of the original survey data and all additional data now available, including the 2007 Census of Agriculture. Other data series considered included United States Department of Agriculture farm program administrative records, shipment records, exports, and quantity processed information. The ASB evaluated the current acreages with historic totals to ensure comparability with past Census relationships. Production, beginning stocks, and recorded disappearance were compared to historic totals for evaluating ending stocks. The 2002-2007 estimates shown herein are considered final and will not be revised again.

At the National level, all revisions to production estimates of major crops (corn, soybeans, all wheat) were less than 1 percent. Production revisions were made in all the years 2003-2007 for all three crops, but in most instances revisions were minor.

Corn production estimates for 2003-2006 were revised down by less than 0.1 percent and 2007 production was revised down 0.3 percent.

Soybean production was revised up slightly for the years 2003, 2004, and 2007. Production levels for 2005 and 2006 were increased 0.2 and 0.3 percent, respectively.

The all wheat production estimate for 2007 was revised down 0.8 percent, 2006 production was revised down 0.2 percent, and the 2005 and 2004 levels were each revised down 0.1 percent. Production in 2003 was revised down by less than 0.1 percent.

¹ Crops included are corn, sorghum, oats, barley, winter wheat, rye, Durum wheat, other spring wheat, rice, soybeans, peanuts, sunflower, cotton, dry edible beans, potatoes, canola, proso millet, and sugarbeets. Harvested acreage is used for all hay, tobacco, and sugarcane in computing total area planted. Includes double cropped acres and unharvested small grains planted as cover crops.

² States do not add to U.S. due to sunflower, canola, and rye unallocated acreage.

Forage Production

Forage production is the sum of all dry hay production and haylage/greenchop production after converting the haylage/greenchop production to a dry equivalent basis (13 percent moisture) by multiplying the green weight (weight at harvest) by 0.4943. The conversion factor (0.4943) is based on the assumption that one ton of dry hay is 0.87 ton of dry matter, one ton of haylage is 0.45 ton dry matter and one ton of greenchop is 0.25 ton dry matter. The total haylage/greenchop production is assumed to be comprised of 90 percent haylage and 10 percent greenchop. Therefore, the conversion factor used to adjust haylage/greenchop production to a dry equivalent basis = $((0.45*0.9)+(0.25*0.1))/0.87 = 0.4943$. The factors assumed here may vary by State and can be adjusted. Adjustments would result in a slightly different conversion factor.
